Dear Stakeholder:

On behalf of the physician and medical student members of the American Medical Association (AMA), I write to request your help urging manufacturers to submit the appropriate applications to the U.S. Food and Drug Administration (FDA) to make naloxone available as a nonprescription over the counter (OTC) medication. The nation's drug-related overdose and death epidemic is being fueled by increasing levels of illicit fentanyl, fentanyl analogs, and drugs contaminated with illicit fentanyl. Naloxone has proven its efficacy in saving lives from opioid-related overdose. Without this medication, it is likely that tens of thousands more Americans would be dead from an opioid-related overdose. **At this stage in the nation's drug overdose epidemic, there is no valid clinical, public policy or ethical reason for drug manufacturers to delay OTC applications.**

AMA policy expressly calls on manufacturers to submit OTC applications. Manufacturers of overdose reversal agents can take a drug that has already been approved for prescription use by the FDA and make it available OTC.¹ The FDA has expressly supported making naloxone a nonprescription OTC product, encouraging drug companies to enter the OTC market by granting priority review to all generic applications for drugs that can be used as emergency treatment of known or suspected opioid overdose.²

The FDA has also created two model labels for both versions of the drug – one for the nasal spray and one for the auto-injector.³ In an unprecedented step, the FDA has already designed, tested and validated these key labeling requirements necessary to approve an OTC version of naloxone.⁴ The FDA has even developed a model Drug Facts label with pictogram instructions to ensure anyone with access can effectively administer it.⁵ This was the first time the FDA proactively developed and tested a drug label to support OTC development. Therefore, any application for an OTC version of naloxone that a manufacturer must complete will be easier than most OTC applications since FDA has already done and approved the labeling portion.

⁵ *Supra* note 6.

Changing the status of all naloxone products to nonprescription and thereby making them available OTC will strengthen the defensive strategies against the nation's drug overdose epidemic by reducing consumer apprehension and ensuring this opioid-related overdose reversal agent is more widely available.

Last year an unprecedented 93,000 people died in the United States from drug-related overdoses, a rise of nearly 30 percent from 2019.⁶ Since 1999, drug-related overdoses have claimed the lives of more than 900,000 people.⁷ The stress and anxiety produced by the COVID-19 pandemic led to increased substance use.⁸ Coupled with disrupted access to outreach and treatment facilities and increased social isolation, this upsurge of substance use undoubtedly contributed to the increase in overdose deaths.⁹ If trends continue at the current pace, drug overdose deaths will surpass the total number of casualties across all major U.S. wars by 2021.¹⁰

Naloxone has decades of evidence demonstrating that it saves lives. There are three FDA-approved forms of naloxone – injectable, auto-injector and nasal spray – and all three currently require a prescription, a condition that limits access for those who are apprehensive to disclose substance abuse issues and for those individuals without health insurance who cannot afford the cost of the product.¹¹

States have increased access by adopting pharmacy-based prescription models to increase availability, including a variety of laws that allow prescribers to prescribe naloxone to patients at risk for overdose.¹² Most states permit pharmacies to dispense naloxone under a standing order, which takes the place of an individual prescription from a provider.¹³ In addition to these measures, some states have permission for “third-party prescriptions” that authorize doctors and pharmacists to prescribe and dispense naloxone to someone who is not directly at risk for an overdose.¹⁴ **While these actions have laudably tried to expand the availability of naloxone, naloxone remains largely unreachable to those most at risk of overdose.**¹⁵ Our nation needs more readily available, evidence-based tools at their fingertips to save lives from overdose.

The AMA and our physician and student members support and encourage individuals to purchase naloxone without the fear of the “drug addict” stigma sometimes associated with the overdose reversal treatment. The AMA believes that making all naloxone products available OTC and ensuring the privacy

of consumers will reduce the number of deaths from opioid-related overdoses. The AMA recognizes the power for policymakers and key stakeholders to have an impactful influence on these manufacturers, and we call on you to send letters demanding that they also submit the applications to make naloxone available as a nonprescription OTC product. Lives are on the line, and we strongly request your support to engage in these positive efforts to save them.

Thank you for your consideration. If you have any questions, please contact Daniel Blaney-Koen, JD, Senior Legislative Attorney, AMA Advocacy Resource Center at daniel.blaney-koen@ama-assn.org.

Sincerely,
